²Department of Statistics, University of Washington

³Department of Biostatistics, University of Washington

⁴Department of Sociology, The Ohio State University

Course Description:

Small area estimation (SAE) is an important endeavor in global health, epidemiology, and increasingly, in demography. SAE is often based on data obtained from complex surveys, and one must acknowledge the survey design when statistical analysis is performed so that measures of uncertainty incorporate sampling variability. Often data in particular areas are sparse (perhaps non-existent) and so spatial smoothing is advantageous to 'borrow strength' from neighboring areas.

We will begin with introductions to complex survey data, SAE, space-time modeling, and Bayesian statistics and then bring these topics together to show how reliable SAE estimation can be performed. The course will end with a complex application: space-time smoothing of under-5 infant mortality using demographic and health survey (DHS) data. This application is part of an on-going collaboration that the instructors have with UNICEF. In this context, the use of both full and summary birth history data will be described. Throughout, hands-on experience will be gained through the use of the instructors' `SUMMER` R package that carries out space-time smoothing of area-level complex survey data, based on methodology that has been developed by the instructors [Li et al., 2019, Wakefield et al., 2019, Wakefield, 2020]. More details on the package, and more

materials are available at <http://faculty.washington.edu/jonno/space-station.html>.

There are no prerequisites, although familiarity with R, Bayesian methods, and mortality measurement would be helpful. Participants should bring their own laptop with R and RStudio installed so that they can follow along and experiment with the data and code.

When you leave the workshop you will:

- Have an overview of small area estimation (SAE).
- Understand the need for special methods for the analysis of survey data.
- Understand the need for special methods for the analysis of spatial data.
- Have a grasp of the basics of Bayesian inference.
